

FlowDesk — Product User Manual

Demo document for Retrieval-Augmented Generation (RAG) pipeline testing.

1. Product Introduction

FlowDesk is a fictional workflow management platform for teams that need to create tasks, assign owners, track status, and review operational metrics.

The platform contains Projects, Tasks, Automations, Reports, Users, and Settings modules.

2. Getting Started

To create an account, enter your company email address, choose a password, and complete multi-factor authentication. Administrators can invite additional users from Settings > Team.

After login, the dashboard displays assigned tasks, overdue items, recently updated projects, and automation alerts.

3. Projects and Tasks

A project contains a collection of related tasks. Each task has a title, description, priority, status, assignee, due date, and optional labels.

Task statuses are Backlog, In Progress, Blocked, Review, and Done. A task marked Blocked should contain a short explanation of the dependency preventing completion.

Users can filter tasks by status, assignee, priority, label, and due-date range.

4. Automations

Automations allow users to trigger actions when specific events occur. For example, a task can automatically be assigned to a team when its status changes to Review.

An automation consists of a trigger, optional conditions, and one or more actions. Administrators can disable an automation without deleting its configuration.

If an automation fails repeatedly, FlowDesk pauses it after five consecutive failures and displays the failure reason in the Automation Center.

5. Reports

The Reports module provides task completion rate, average cycle time, overdue-task count, workload by user, and project progress.

Cycle time is calculated from the moment a task enters In Progress until it enters Done. Time spent in Backlog is excluded from cycle-time calculations.

6. API Access

FlowDesk provides a REST API. API requests use Bearer token authentication. Tokens should be stored securely and never committed to source-code repositories.

The task endpoint accepts fields including title, description, priority, status, assignee_id, due_date, and labels.

The API returns HTTP 401 when authentication is missing or invalid, HTTP 403 when the authenticated user lacks permission, and HTTP 404 when the requested resource does not exist.

7. Troubleshooting

Login problem: verify the email address, password, and MFA code. If the account is locked after repeated failed attempts, contact an administrator.

Automation not running: check whether the automation is enabled, whether its trigger conditions are satisfied, and whether it has been paused after repeated failures.

Report numbers appear outdated: refresh the report and check the report's data timestamp. Some aggregated reports are refreshed every 15 minutes.
